## Abstract

In 1970, Levine introduced generalized closed sets in topological spaces in order to extend many of the important properties of closed sets to a large family. In the recent past, there has been considerable interest in the study of various forms of generalized closed sets. The authors introduced *sarps*-closed sets in topological spaces. In this, we introduce a new class of function called contra *sarps*-continuous functions by using *sarps*-closed sets and characterize their basic properties. Further the relationship between this new class with other classes of existing contra continuous functions are established. Also we define contra *sarps*-irresolute, perfectly contra *sarps*-irresolute and almost contra *sarps*-continuous functions and we have given the relationship of these three functions with contra *sarps*-continuous functions.

## Keywords

Contra *sarps*-continuous

Contra *sarps*-irresolute

Perfectly contra *sarps*-irresolute

Almost contra *sarps*-continuous

## 1. Introduction

In 1968, M. K. Singal and A. R. Singal [1] introduced almost continuous mappings. In 1986, T. Noiri introduced the concept of perfectly continuous. In 1996, J. Dontchev [2] introduced the notion of contra continuity. In 1999, J. Dontchev and T. Noiri [3] introduced new class of functions, called contra semi-continuous functions. The authors introduced *sarps*-closed sets in topological spaces. The purpose of this paper is to introduce a new class of functions, namely contra *sarps*-continuous functions in topological spaces.

## 2. Preliminaries

Throughout this paper  $X$  and  $Y$  represent the topological spaces on which no separation axioms are assumed unless otherwise mentioned. For a subset  $A$  of a topological space  $X$ ,  $clA$  and  $intA$  denote the closure of  $A$  and the interior of  $A$  respectively.  $X \setminus A$  denotes the complement of  $A$  in  $X$ . We recall the following definitions and results.

**Definition 2.1:** A subset  $A$  of a space  $X$  is called

(i) semi-open [19] if  $A \subseteq cl\ int A$  and semi-closed if  $int\ cl A \subseteq A$ .

(ii)  $\alpha$ -open [24] if  $A \subseteq int\ cl\ int A$  and  $\alpha$ -closed if  $cl\ int\ cl A \subseteq A$ .

\*Corresponding author,  
E-mail : subithaaus@gmail.com

(iii)  $\pi$ -open [4] if  $A$  is the union of regular open sets and  $\pi$ -closed if  $A$  is the intersection of regular closed sets.

The semi-closure (resp. pre-closure, resp. semi-pre-closure, resp.  $\alpha$ -closure, resp. b-closure) of a subset  $A$  of  $X$  is the intersection of all semi-closed (resp. pre-closed, resp. semi-pre-closed, resp.  $\alpha$ -closed, resp. b-closed) sets containing  $A$  and is denoted by  $sclA$  (resp.  $pclA$ , resp.  $spclA$ , resp.  $\alpha clA$ , resp.  $bclA$ ).

**Definition 2.2:** A subset  $A$  of a space  $X$  is called g-closed [20] (resp. rg-closed [26], resp.  $\alpha g$ -closed [21], resp. gs-closed [5], resp. gp-closed [22], resp. gpr-closed [13], resp. gsp-closed [8], resp.  $\pi g$ -closed [11], resp.  $\pi g p$ -closed [27], resp.  $\pi g \alpha$ -closed [17], resp.  $\pi g b$ -closed [4], resp. rwg-closed [35], resp. gb-closed [1], resp.  $g^*p$ -closed [36], resp. rgb-closed [23], resp.  $*g$ -closed [37]) if  $clA \subseteq U$  (resp.  $clA \subseteq U$ , resp.  $\alpha clA \subseteq U$ , resp.  $sclA \subseteq U$ , resp.  $pclA \subseteq U$ , resp.  $pclA \subseteq U$ , resp.  $spclA \subseteq U$ , resp.  $clA \subseteq U$ , resp.  $pclA \subseteq U$ , resp.  $\alpha clA \subseteq U$ , resp.  $bclA \subseteq U$ , resp.  $cl \text{ int} A \subseteq U$ , resp.  $bclA \subseteq U$ , resp.  $pclA \subseteq U$ , resp.  $bclA \subseteq U$ , resp.  $clA \subseteq U$ ) whenever  $A \subseteq U$  and  $U$  is open (resp. regular open, resp. open, resp. open, resp. open, resp. regular open, resp. open, resp.  $\pi$ -open, resp.  $\pi$ -open, resp.  $\pi$ -open, resp.  $\pi$ -open, resp. regular open, resp. open, resp. g-open, resp. regular open, resp.  $\hat{g}$ -open.).

### Definition 2.3 [33]

A subset  $A$  of a space  $X$  is called semi  $\alpha$ -regular pre-semi closed (briefly *sarps*-closed) if

$sclA \subseteq U$  whenever  $A \subseteq U$  and  $U$  is *arps*-open.

The complements of the above mentioned closed sets are their respective open sets. For example, a subset  $B$  of a space  $X$  is generalized open (briefly g-open) if  $X \setminus B$  is g-closed.

### Definition 2.4

(i) A function  $f: (X, \tau) \rightarrow (Y, \sigma)$  is called [6] if  $f^{-1}(V)$  is closed in  $(X, \tau)$  for every closed subset  $V$  of  $(Y, \sigma)$ .

(ii) A function  $f: (X, \tau) \rightarrow (Y, \sigma)$  is called perfectly-continuous [25] if  $f^{-1}(V)$  is clopen in  $(X, \tau)$  for every closed subset  $V$  of  $(Y, \sigma)$ .

(iii) A function  $f: (X, \tau) \rightarrow (Y, \sigma)$  is called regular set connected [14] if  $f^{-1}(V)$  is clopen in  $(X, \tau)$  for every regular closed subset  $V$  of  $(Y, \sigma)$ .

(iv) almost continuous[31] if  $f^{-1}(V)$  is closed in  $(X, \tau)$  for every regular closed subset  $V$  of  $(Y, \sigma)$ .

### Definition 2.5[29]

(i) A function  $f: (X, \tau) \rightarrow (Y, \sigma)$  is called *sarps*-

continuous if  $f^{-1}(V)$  is *sarps*-closed in  $(X, \tau)$  for every closed subset  $V$  of  $(Y, \sigma)$ .

(ii) A function  $f: (X, \tau) \rightarrow (Y, \sigma)$  is called *sarps*-irresolute if  $f^{-1}(V)$  is *sarps*-closed in  $(X, \tau)$  for every *sarps*-closed subset  $V$  of  $(Y, \sigma)$ .

(iii) A function  $f: (X, \tau) \rightarrow (Y, \sigma)$  is called almost *sarps*-continuous if  $f^{-1}(V)$  is *sarps*-closed in  $(X, \tau)$  for every regular closed subset  $V$  of  $(Y, \sigma)$ .

### Definition 2.6

A function  $f: (X, \tau) \rightarrow (Y, \sigma)$  is called *sarps*-closed (resp. *sarps*-open) if for every closed (resp. open) set  $U$  of  $(X, \tau)$ , the set  $f(U)$  is *sarps*-closed (resp. *sarps*-open) in  $(Y, \sigma)$ .

### Definition 2.7

A function  $f: (X, \tau) \rightarrow (Y, \sigma)$  is called contra continuous [9] (resp. contra semi-continuous [10], resp. contra  $\pi$ -continuous [12], resp. contra  $\alpha$ -continuous [16], resp. contra g-continuous [6], resp. contra rg-continuous [34], resp. contra  $\alpha g$ -continuous [3], resp. contra gs-continuous [14], resp. contra gp-continuous [7], resp. contra gpr-continuous [14], resp. contra gsp-continuous [3], resp. contra  $\pi g$ -continuous [12], resp. contra  $\pi g p$ -continuous [7], resp. contra  $\pi g b$ -continuous [32], resp. contra rwg-continuous [34], resp. contra gb-continuous [2], resp. contra  $g^*p$ -continuous [3], resp. contra  $\pi g \alpha$ -continuous [17], resp. contra  $*g$ -continuous [34], resp. contra rgb-continuous [30]) if  $f^{-1}(V)$  is closed (resp. semi-closed, resp.  $\pi$ -closed, resp.  $\alpha$ -closed, resp. g-closed, resp. rg-closed, resp.  $\alpha g$ -closed, resp. gs-closed, resp. gp-closed, resp. gpr-closed, resp. gsp-closed, resp.  $\pi g$ -closed, resp.  $\pi g p$ -closed, resp.  $\pi g b$ -closed, resp. rwg-closed, resp. gb-closed, resp.  $g^*p$ -closed, resp.  $\pi g \alpha$ -closed, resp.  $*g$ -closed, resp. rgb-closed) in  $(X, \tau)$  for every open subset  $V$  of  $(Y, \sigma)$ .

### Lemma 2.8

Every closed set is *sarps*-closed.

### Definition 2.9 [18]

A space  $X$  is called locally indiscrete if every open subset of  $X$  is closed.

### Contra *SaRPS*-continuous functions

### Definition 3.1

A function  $f: (X, \tau) \rightarrow (Y, \sigma)$  is called contra *sarps*-continuous if  $f^{-1}(V)$  is *sarps*-closed in  $(X, \tau)$  for

every open subset  $V$  of  $(Y, \sigma)$ .

### Proposition 3.2

If A function  $f: (X, \tau) \rightarrow (Y, \sigma)$  from a topological space  $X$  into a topological space  $Y$  is contra-continuous, then it is contra *sarps*-continuous.

### Proof

Assume that the function  $f: (X, \tau) \rightarrow (Y, \sigma)$  is contra-continuous. Let  $V$  be an open subset of  $(Y, \sigma)$ . Since  $f$  is contra-continuous,  $f^{-1}(V)$  is closed in  $(X, \tau)$ . By Lemma 2.8,  $f^{-1}(V)$  is *sarps*-closed in  $(X, \tau)$ . Hence  $f$  is contra *sarps*-continuous.

Converse of the above Proposition need not be true as shown in the following example.

### Example 3.3

Let  $X = \{a, b, c\}$  with topology  $\tau = \{\emptyset, \{a\}, \{b, c\}, X\}$  and  $Y = \{p, q\}$  with topology  $\sigma = \{\emptyset, \{p\}, Y\}$ . Let  $f: (X, \tau) \rightarrow (Y, \sigma)$  be defined as  $f(a) = f(c) = q$ ,  $f(b) = p$ . Then  $f$  is contra *sarps*-continuous, but not contra-continuous.

### Proposition 3.4

Let  $f: (X, \tau) \rightarrow (Y, \sigma)$  be a function. Then

- (i) if  $f$  is contra semi-continuous, then  $f$  is contra *sarps*-continuous.
- (ii) if  $f$  is contra  $\pi$ -continuous, then  $f$  is contra  $\pi$ -continuous.
- (iii) if  $f$  is contra  $\alpha$ -continuous, then  $f$  is contra  $\alpha$ -continuous.

### Proof

Suppose  $f$  is contra semi-continuous (resp. contra  $\pi$ -continuous, resp. contra  $\alpha$ -continuous). Let  $V$  be an open subset of  $(Y, \sigma)$ . Since  $f$  is contra semi-continuous (resp. contra  $\pi$ -continuous, resp. contra  $\alpha$ -continuous),  $f^{-1}(V)$  is semi-closed (resp.  $\pi$ -closed, resp.  $\alpha$ -closed) in  $(X, \tau)$ . Using Proposition 3.2 of [33],  $f^{-1}(V)$  is *sarps*-closed in  $(X, \tau)$ . Then by using Definition 3.1,  $f$  is contra *sarps*-continuous. This proves (i), (ii) and (iii).

The reverse implications need not be true as shown in the Example 3.5.

### Example 3.5

Let  $X = Y = \{a, b, c\}$  with topologies  $\tau = \{\emptyset, \{a\}, \{b, c\}, X\}$  and  $\sigma = \{\emptyset, \{a\}, Y\}$  on  $X$  and  $Y$  respectively. Let the function  $f: (X, \tau) \rightarrow (Y, \sigma)$  be defined as  $f(a) = c$ ,  $f(b) = a$ ,  $f(c) = b$ .

Then  $f$  is contra *sarps*-continuous, but not contra semi-continuous, not contra  $\pi$ -continuous, not contra  $\alpha$ -continuous.

### Proposition 3.6

Let  $f: (X, \tau) \rightarrow (Y, \sigma)$  be a function. Then

- (i) if  $f$  is contra *sarps*-continuous, then  $f$  is contra *gs*-continuous.
- (ii) if  $f$  is contra *sarps*-continuous, then  $f$  is contra *rgb*-continuous.
- (iii) if  $f$  is contra *sarps*-continuous, then  $f$  is contra *rgb*-continuous.
- (iv) if  $f$  is contra *sarps*-continuous, then  $f$  is contra *gb*-continuous.
- (v) if  $f$  is contra *sarps*-continuous, then  $f$  is contra *gsp*-continuous.

### Proof

Suppose  $f$  is contra *sarps*-continuous. Let  $V$  be an open subset of  $(Y, \sigma)$ . Since  $f$  is contra *sarps*-continuous,  $f^{-1}(V)$  is *sarps*-closed in  $(X, \tau)$ . Then by using Proposition 3.4 of [33],  $f^{-1}(V)$  is *gs*-closed (resp. *rgb*-closed, resp. *rgb*-closed) in  $(X, \tau)$ . Therefore  $f$  is contra *gs*-continuous (resp. contra *rgb*-continuous, resp. contra *rgb*-continuous). This proves (i), (ii) and (iii). Since *gs*-closed  $\Rightarrow$  *gb*-closed  $\Rightarrow$  *gsp*-closed, the proof for (iv) and (v) follows from (i).

The reverse implications need not be true as shown in the Example 3.7.

### Example 3.7

Let  $X = Y = \{a, b, c, d\}$  with topologies  $\tau = \{\emptyset, \{a\}, \{b\}, \{a, b\}, \{b, c\}, \{a, b, c\}, X\}$  and  $\sigma = \{\emptyset, \{a, c\}, Y\}$  on  $X$  and  $Y$  respectively.

Let the function  $f: (X, \tau) \rightarrow (Y, \sigma)$  be defined as  $f(a) = b$ ,  $f(b) = a$ ,  $f(c) = b$ ,  $f(d) = c$ . Then  $f$  is contra *gs*-continuous, contra *rgb*-continuous, contra *rgb*-continuous, contra *gb*-continuous, contra *gsp*-continuous, but not contra *sarps*-continuous.

The concept contra *sarps*-continuous is independent from the concepts contra *ag*-continuous, contra *pg*-continuous, contra *gp*-continuous, contra *pgp*-continuous, contra *pg*-continuous, contra *gp*-continuous, contra *g*-continuous, contra *gpr*-continuous, contra *rwg*-continuous, contra *g*-continuous as shown in the following examples.

### Example 3.8

From Example 3.7,  $f^{-1}(\{a, c\}) = \{b, d\}$  is *ag*-closed, *pg*-closed, *gp*-closed, *pgp*-closed, *pg*-closed, *g*-closed in  $(X, \tau)$ . Hence  $f$  is contra *ag*-continuous, contra *pg*-continuous, contra *gp*-continuous, contra *pgp*-continuous, contra *pg*-continuous, contra *gp*-continuous, but not contra *sarps*-continuous.

**Example 3.9**

Let  $X = Y = \{a, b, c, d\}$  with topologies  $\tau = \{\emptyset, \{a\}, \{b\}, \{a, b\}, \{b, c\}, \{a, b, c\}, X\}$  and  $\sigma = \{\emptyset, \{b\}, Y\}$  on  $X$  and  $Y$  respectively. Let the function  $f: (X, \tau) \rightarrow (Y, \sigma)$  be defined as  $f(a) = b, f(b) = a, f(c) = b, f(d) = c$ . Then  $f$  is contra *sarps*-continuous, but not contra *ag*-continuous, not contra *πg*-continuous, not contra *gp*-continuous, not contra *πgp*-continuous, not contra  $g^*$ -continuous.

**Example 3.10**

Let  $X = Y = \{a, b, c, d\}$  with topologies  $\tau = \{\emptyset, \{a\}, \{a, b\}, X\}$  and  $\sigma = \{\emptyset, \{d\}, Y\}$  on  $X$  and  $Y$  respectively. Let the function  $f: (X, \tau) \rightarrow (Y, \sigma)$  be defined as  $f(a) = b, f(b) = d, f(c) = a, f(d) = c$ . Then  $f$  is contra *sarps*-continuous, but not contra *g*-continuous.

**Example 3.11**

Let  $X = Y = \{a, b, c, d\}$  with topologies  $\tau = \{\emptyset, \{a\}, \{a, b\}, X\}$  and  $\sigma = \{\emptyset, \{b, c\}, Y\}$  on  $X$  and  $Y$  respectively. Let the function  $f: (X, \tau) \rightarrow (Y, \sigma)$  be defined as  $f(a) = c, f(b) = d, f(c) = b, f(d) = a$ . Then  $f$  is contra *g*-continuous, but not contra *sarps*-continuous.

**Example 3.12**

Let  $X = Y = \{a, b, c\}$  with topologies  $\tau = \{\emptyset, \{a\}, \{b\}, \{a, b\}, X\}$  and  $\sigma = \{\emptyset, \{c\}, Y\}$  on  $X$  and  $Y$  respectively. Let the function  $f: (X, \tau) \rightarrow (Y, \sigma)$  be defined as  $f(a) = c, f(b) = a, f(c) = b$ . Then  $f$  is contra *sarps*-continuous, but not contra *gpr*-continuous.

**Example 3.13**

Let  $X = Y = \{a, b, c\}$  with topologies  $\tau = \{\emptyset, \{a\}, \{b\}, \{a, b\}, X\}$  and  $\sigma = \{\emptyset, \{b, c\}, Y\}$  on  $X$  and  $Y$  respectively. Let the function  $f: (X, \tau) \rightarrow (Y, \sigma)$  be defined as  $f(a) = b, f(b) = c, f(c) = a$ . Then  $f$  is contra *gpr*-continuous, but not contra *sarps*-continuous.

**Example 3.14**

Let  $X = Y = \{a, b, c, d\}$  with topologies  $\tau = \{\emptyset, \{a\}, \{b\}, \{a, b\}, \{a, b, c\}, X\}$  and  $\sigma = \{\emptyset, \{c\}, Y\}$  on  $X$  and  $Y$  respectively. Let the function  $f: (X, \tau) \rightarrow (Y, \sigma)$  be defined as  $f(a) = b, f(b) = c, f(c) = d, f(d) = a$ . Then  $f$  is contra *sarps*-continuous, but not contra *rwg*-continuous and contra  $^*$ *g*-continuous.

**Example 3.15**

Let  $X = Y = \{a, b, c, d\}$  with topologies  $\tau = \{\emptyset, \{a\}, \{b\}, \{a, b\}, \{a, b, c\}, X\}$  and  $\sigma = \{\emptyset, \{c, d\}, Y\}$  on  $X$  and  $Y$  respectively. Let the function  $f: (X, \tau) \rightarrow (Y, \sigma)$  be defined as  $f(a) = c, f(b) = d, f(c) = a, f(d) = c$ . Then  $f$  is contra *rwg*-continuous and contra  $^*$ *g*-continuous, but not contra *sarps*-continuous.

**Example 3.16**

Let  $X = Y = \{a, b, c\}$  with topologies  $\tau = \{\emptyset, \{a\}, \{b\}, \{a, b\}, \{a, b, c\}, \{a, b, d\}, X\}$  and  $\sigma = \{\emptyset, \{b, c, d\}, Y\}$  on  $X$  and  $Y$  respectively. Let the function  $f: (X, \tau) \rightarrow (Y, \sigma)$  be defined as  $f(a) = b, f(b) = c, f(c) = d, f(d) = a$ . Then  $f$  is contra *rg*-continuous, but not contra *sarps*-continuous.

**Example 3.17**

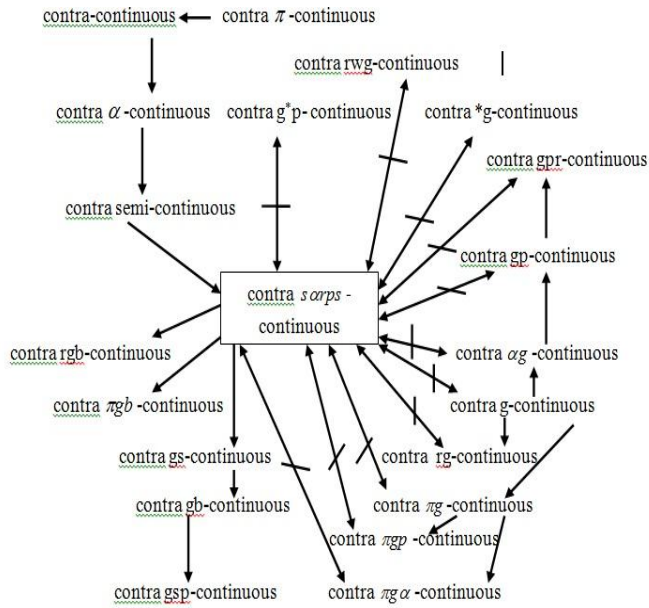

Let  $X = Y = \{a, b, c, d\}$  with topologies  $\tau = \{\emptyset, \{a\}, \{b\}, \{a, b\}, \{a, b, c\}, \{a, b, d\}, X\}$  and  $\sigma = \{\emptyset, \{d\}, Y\}$  on  $X$  and  $Y$  respectively. Let the function  $f: (X, \tau) \rightarrow (Y, \sigma)$  be defined as  $f(a) = d, f(b) = c, f(c) = b, f(d) = a$ . Then  $f$  is contra *sarps*-continuous, but not contra *rg*-continuous. The concept of *sarps*-continuity and contra *sarps*-continuity are independent of each other as shown in the Examples 3.18 and 3.19.

**Example 3.18**

Let  $X = Y = \{a, b, c, d\}$  with topologies  $\tau = \{\emptyset, \{a\}, \{b\}, \{a, b\}, \{b, c\}, \{a, b, c\}, X\}$  and  $\sigma = \{\emptyset, \{a, c, d\}, Y\}$  on  $X$  and  $Y$  respectively. Let the function  $f: (X, \tau) \rightarrow (Y, \sigma)$  be defined as  $f(a) = b, f(b) = a, f(c) = b, f(d) = c$ . Then  $f$  is *sarps*-continuous, but not contra *sarps*-continuous.

**Example 3.19**

Let  $X = Y = \{a, b, c, d\}$  with topologies  $\tau = \{\emptyset, \{a\}, \{a, b\}, X\}$  and  $\sigma = \{\emptyset, \{a, d\}, Y\}$  on  $X$  and  $Y$  respectively. Let the function  $f: (X, \tau) \rightarrow (Y, \sigma)$  be defined as  $f(a) = c, f(b) = d, f(c) = b, f(d) = a$ . Then  $f$  is contra *sarps*-continuous, but not *sarps*-continuous. Thus the above discussions lead to the following diagram. In this diagram, " $A \rightarrow B$ " means  $A$  implies  $B$  but not conversely and " $A \longleftrightarrow B$ " means  $A$  and  $B$  are independent of each other.

### Definition 3.20

A function  $f: (X, \tau) \rightarrow (Y, \sigma)$  is called contra *sarps*-irresolute if  $f^{-1}(V)$  is *sarps*-closed in  $(X, \tau)$  for every *sarps*-open subset  $V$  of  $(Y, \sigma)$ . The concepts of *sarps*-irresolute and contra *sarps*-irresolute are independent of each other as shown in the Examples 3.21 and 3.22.

### Example 3.21

Let  $X = Y = \{a, b, c\}$  with topologies  $\tau = \{\emptyset, \{b, c\}, X\}$  and  $\sigma = \{\emptyset, \{a\}, \{a, c\}, Y\}$  on  $X$  and  $Y$  respectively. Let the function  $f: (X, \tau) \rightarrow (Y, \sigma)$  be defined as  $f(a) = a$ ,  $f(b) = b$ ,  $f(c) = c$ . Then  $f$  is contra *sarps*-irresolute, but not *sarps*-irresolute.

### Example 3.22

Let  $X = Y = \{a, b, c\}$  with topologies  $\tau = \{\emptyset, \{a\}, \{b\}, \{a, b\}, X\}$  and  $\sigma = \{\emptyset, \{b, c\}, Y\}$  on  $X$  and  $Y$  respectively. Let the function  $f: (X, \tau) \rightarrow (Y, \sigma)$  be defined as  $f(a) = b$ ,  $f(b) = c$ ,  $f(c) = a$ . Then  $f$  is *sarps*-irresolute, but not contra *sarps*-irresolute.

### Theorem 3.23

Every contra *sarps*-irresolute function is contra *sarps*-continuous.

### Proof

Suppose  $f: (X, \tau) \rightarrow (Y, \sigma)$  is contra *sarps*-irresolute. Let  $V$  be any open subset of  $(Y, \sigma)$ . Since every open set is semi-open and by using Proposition 3.2 of [28],  $V$  is *sarps*-open in  $(Y, \sigma)$ . Since  $f$  is contra *sarps*-irresolute,  $f^{-1}(V)$  is *sarps*-closed in  $(X, \tau)$ . Hence  $f$  is contra *sarps*-continuous. Converse of

the above theorem need not be true as seen in the following example.

### Example 3.24

Let  $X = Y = \{a, b, c\}$  with topologies  $\tau = \{\emptyset, \{a\}, \{a, c\}, X\}$  and  $\sigma = \{\emptyset, \{c\}, \{b, c\}, Y\}$  on  $X$  and  $Y$  respectively. Let the function  $f: (X, \tau) \rightarrow (Y, \sigma)$  be defined as  $f(a) = a$ ,  $f(b) = b$ ,  $f(c) = c$ . Then  $f$  is contra *sarps*-continuous, but not contra *sarps*-irresolute.

### Theorem 3.25

Let  $f: (X, \tau) \rightarrow (Y, \sigma)$  and  $g: (Y, \sigma) \rightarrow (Z, \mu)$  be two functions. Let  $h = g \circ f$ . Then

- $h$  is contra *sarps*-continuous if  $f$  is contra *sarps*-continuous and  $g$  is continuous.
- $h$  is contra *sarps*-continuous if  $f$  is *sarps*-irresolute and  $g$  is contra-continuous.
- $h$  is contra *sarps*-continuous if  $f$  is *sarps*-irresolute and  $g$  is contra *sarps*-continuous.
- $h$  is *sarps*-continuous and contra *sarps*-continuous if  $f$  is contra *sarps*-continuous and  $g$  is perfectly-continuous.
- $h$  is *sarps*-continuous if  $f$  is contra *sarps*-continuous and  $g$  is contra-continuous.

### Proof

(i) Let  $V$  be open in  $(Z, \mu)$ . Since  $g$  is continuous,  $g^{-1}(V)$  is open in  $(Y, \sigma)$ . Since  $f$  is contra *sarps*-continuous,  $f^{-1}(g^{-1}(V))$  is *sarps*-closed in  $(X, \tau)$ . That is,  $(g \circ f)^{-1}(V)$  is *sarps*-closed in  $(X, \tau)$ . This proves (i).

(ii) Let  $V$  be open in  $(Z, \mu)$ . Since  $g$  is contra-continuous,  $g^{-1}(V)$  is closed in  $(Y, \sigma)$ . By Lemma 2.8,  $g^{-1}(V)$  is *sarps*-closed in  $(Y, \sigma)$ . Since  $f$  is *sarps*-irresolute,  $f^{-1}(g^{-1}(V))$  is *sarps*-closed in  $(X, \tau)$ . That is,  $(g \circ f)^{-1}(V)$  is *sarps*-closed in  $(X, \tau)$ . This proves (ii).

(iii) Let  $V$  be open in  $(Z, \mu)$ . Since  $g$  is contra *sarps*-continuous,  $g^{-1}(V)$  is *sarps*-closed in  $(Y, \sigma)$ . Since  $f$  is *sarps*-irresolute,  $f^{-1}(g^{-1}(V))$  is *sarps*-closed in  $(X, \tau)$ . That is,  $(g \circ f)^{-1}(V)$  is *sarps*-closed in  $(X, \tau)$ . This proves (iii).

(iv) Let  $V$  be closed in  $(Z, \mu)$ . Since  $g$  is perfectly-continuous,  $g^{-1}(V)$  is clopen in  $(Y, \sigma)$ . Since  $f$  is contra *sarps*-continuous,  $f^{-1}(g^{-1}(V))$  is both *sarps*-closed and *sarps*-open in  $(X, \tau)$ . That is,  $(g \circ f)^{-1}(V)$  is both *sarps*-closed and *sarps*-open in  $(X, \tau)$ . This proves (iv).

(v) Let  $V$  be closed in  $(Z, \mu)$ . Since  $g$  is contra-continuous,  $g^{-1}(V)$  is open in  $(Y, \sigma)$ . Since  $f$  is contra *scarps*-continuous,  $f^{-1}(g^{-1}(V))$  is *scarps*-closed in  $(X, \tau)$ . That is,  $(g \circ f)^{-1}(V)$  is *scarps*-closed in  $(X, \tau)$ . This proves (v).

### Theorem 3.26

Let  $f: (X, \tau) \rightarrow (Y, \sigma)$  be surjective, *scarps*-irresolute and *scarps*-open and  $g: (Y, \sigma) \rightarrow (Z, \mu)$  be any function. Let every *scarps*-open set in  $(X, \tau)$  be open. Then  $g \circ f$  is contra *scarps*-continuous if and only if  $g$  is contra *scarps*-continuous.

### Proof

Assume that  $g \circ f$  is contra *scarps*-continuous. Let  $V$  be closed in  $(Z, \mu)$ . Since  $g \circ f$  is contra *scarps*-continuous,  $(g \circ f)^{-1}(V)$  is *scarps*-open in  $(X, \tau)$ . By assumption,  $(g \circ f)^{-1}(V)$  is open in  $(X, \tau)$ . That is  $f^{-1}(g^{-1}(V))$  is open in  $(X, \tau)$ . Since  $f$  is *scarps*-open,  $f(f^{-1}(g^{-1}(V)))$  is *scarps*-open in  $(Y, \sigma)$ . That is  $g^{-1}(V)$  is *scarps*-open in  $(Y, \sigma)$ . Hence  $g$  is contra *scarps*-continuous. The converse part follows from Theorem 3.25(iii).

### Theorem 3.27

The following are equivalent for a function  $f: (X, \tau) \rightarrow (Y, \sigma)$ .

- (i)  $f$  is contra *scarps*-continuous.
- (ii) The inverse image of each closed set in  $(Y, \sigma)$  is *scarps*-open in  $(X, \tau)$ .

### Proof

(i)  $\Rightarrow$  (ii)

Suppose (i) holds. Let  $V$  be closed in  $(Y, \sigma)$ . Then  $Y \setminus V$  is open in  $(Y, \sigma)$ . By assumption,  $f^{-1}(Y \setminus V)$  is *scarps*-closed in  $(X, \tau)$ . But  $f^{-1}(Y \setminus V) = X \setminus f^{-1}(V)$  which is *scarps*-closed in  $(X, \tau)$ . Therefore  $f^{-1}(V)$  is *scarps*-open in  $(X, \tau)$ . This proves (i)  $\Rightarrow$  (ii).

(ii)  $\Rightarrow$  (i)

Let  $V$  be open in  $(Y, \sigma)$ . Then  $Y \setminus V$  is closed in  $(Y, \sigma)$ . By assumption,  $f^{-1}(Y \setminus V)$  is *scarps*-open in  $(X, \tau)$ . But  $f^{-1}(Y \setminus V) = X \setminus f^{-1}(V)$  which is *scarps*-open in  $(X, \tau)$ . Therefore  $f^{-1}(V)$  is *scarps*-closed in  $(X, \tau)$ . This proves (ii)  $\Rightarrow$  (i).

### Definition 3.28

A function  $f: (X, \tau) \rightarrow (Y, \sigma)$  is called perfectly contra

*scarps*-irresolute if  $f^{-1}(V)$  is both *scarps*-closed and *scarps*-open in  $(X, \tau)$  for every *scarps*-open subset  $V$  of  $(Y, \sigma)$ .

### Theorem 3.29

A function  $f$  is perfectly contra *scarps*-irresolute if and only if  $f$  is contra *scarps*-irresolute and *scarps*-irresolute.

### Proof

Suppose  $f$  is perfectly contra *scarps*-irresolute. Let  $V$  be *scarps*-open in  $Y$ . Since  $f$  is perfectly contra *scarps*-irresolute,  $f^{-1}(V)$  is both *scarps*-closed and *scarps*-open in  $(X, \tau)$ . Hence  $f$  is contra *scarps*-irresolute and *scarps*-irresolute.

Conversely, suppose  $f$  is contra *scarps*-irresolute and *scarps*-irresolute. Let  $V$  be *scarps*-open in  $(Y, \sigma)$ . Since  $f$  is contra *scarps*-irresolute and *scarps*-irresolute,  $f^{-1}(V)$  is both *scarps*-closed and *scarps*-open in  $(X, \tau)$ . Hence  $f$  is perfectly contra *scarps*-irresolute.

### Definition 3.30

A function  $f: (X, \tau) \rightarrow (Y, \sigma)$  is called almost contra *scarps*-continuous if  $f^{-1}(V)$  is *scarps*-closed in  $(X, \tau)$  for every regular open subset  $V$  of  $(Y, \sigma)$ .

### Theorem 3.31

Every contra *scarps*-continuous function is almost contra *scarps*-continuous.

### Proof

Let  $f: (X, \tau) \rightarrow (Y, \sigma)$  be a function. Suppose  $f$  is contra *scarps*-continuous. Let  $V$  be a regular open subset of  $(Y, \sigma)$ . Since every regular open set is open,  $V$  is open in  $(Y, \sigma)$ . Since  $f$  is contra *scarps*-continuous,  $f^{-1}(V)$  is *scarps*-closed in  $(X, \tau)$ . Hence  $f$  is almost *scarps*-continuous.

### Conclusion

In this paper, we introduced and investigated the notion of contra *scarps*-continuous functions by utilizing *scarps*-closed sets. We obtained fundamental properties of contra *scarps*-continuous functions and discussed the relationships between contra *scarps*-continuity and other related functions.
